this book focuses on mega droughts of the past 20 years twelve cases from both developed and developing countries are elaborated in the book its intention is to draw lessons from the cases of extremely severe water shortages so that countries and stakeholders can be better prepared for extreme drought events in the future several recurrent themes emerge from the diverse case studies and descriptions of programs for example most chapters discuss the necessity to move from reactive compensatory to preventive policies this theme has implications for use of insurance in developing countries e g is insurance encouraging investments to help countries avoid disasters or is it acting mostly in a humanitarian way to compensate for losses to help people several authors point to the importance of risk assessment and to developing risk based policies for drought this raises statistical issues of how such assessments of uncertainty and risks are done and how they relate to actual occurrence of events most chapters call for more inter sectoral policies policies which integrate water resources management approaches and to the necessity of raising public awareness of droughts in times of no drought the issue of structural versus nonstructural is clear in most cases while often cast as either or the message that emerges is more one of how do you integrate these approaches finally a few chapters bring to light how prevention is needed for national security as well as water security in focus a book series that showcases the latest accomplishments in water research each book focuses on a specialist area with papers from top experts in the field it aims to be a vehicle for in depth understanding and inspire further conversations in the sector

this book presents the basic principles for evaluating water quality and treatment plant performance in a clear innovative and didactic way using a combined approach that involves the interpretation of monitoring data associated with i the basic processes that take place in water bodies and in water and wastewater treatment plants and ii data management and statistical calculations to allow a deep interpretation of the data this book is problem oriented and works from practice to theory covering most of the information you will need such as a obtaining flow data and working with the concept of loading b organizing sampling programmes and measurements c connecting laboratory analysis to data management e using numerical and graphical methods for describing monitoring data descriptive statistics f understanding and reporting removal efficiencies g recognizing symmetry and asymmetry in monitoring data normal and log normal distributions h evaluating compliance with targets and regulatory standards for effluents and water bodies i making comparisons with the monitoring data tests of hypothesis j understanding the relationship between monitoring variables correlation and regression analysis k making water and mass balances l understanding the different loading rates applied to treatment units m learning the principles of reaction kinetics and reactor hydraulics and n performing calibration and verification of models the major concepts are illustrated by 92 fully worked out examples which are supported by 75 freely downloadable excel spreadsheets each

chapter concludes with a checklist for your report if you are a student researcher or practitioner planning to use or already using treatment plant and water quality monitoring data then this book is for you 75 excel spreadsheets are available to download
